

Scheduled-release THT(D) after the HCA execution-identity repair

Each bag: sum of segment (completion – common canonical D). Min/mean/max are population statistics within each seed.
Clock scope: native-start rankings can differ (see report). Common D is not verified as Feng's exact timing implementation.
Large points: mean of 10 seed statistics. Faint points: individual seeds. Whiskers: seed min-max (not confidence intervals).
60 new HCA identity-repair runs; 120 frozen G31/V5 cells reused. Independent scheduled EBS segments are retained for all methods.
Historical HCA (43/60 accounting anomalies) is excluded from these plots. New accounting validation is not an exhaustive physical proof.
