

Scheduled-release THT: V5 reconstructed DH and archived G31/HCA observations

Each bag: sum of segment (completion – common canonical scheduled release). Min/mean/max are bag-population statistics within each seed.
Large points: mean of 10 seed statistics. Faint points: individual seeds. Whiskers: observed seed min-max (not confidence intervals).
V5 is a disclosed-assumption DH reconstruction. G31/HCA use archived controls; the historical HCA build hash is unavailable.
HCA: 43/60 archived cells have segment-accounting anomalies; see control audit. Purple points are observed records, not clean capacity evidence.
